

Recommended Tree Planting Detail

AMENDED BACKFILL MIXTURE:

- 1/3 'NATURE'S HELPER' – 2 cfbags
(1 bag per 2" of caliper)
- 2/3 EXISTING SOIL – broken/loose

NOTE: Incorporate 'DIEHARD' Root Stimulator into top 1/3 of the amended backfill mixture. (8oz packet / 2" caliper)

Apply 17-17-17 Fertilizer April 15 & June 15. 1 cup (8oz) per caliper inch. Spread evenly over outer 1/3 of rootball.

WIDTH OF HOLE SHOULD BE A MIN. 12" WIDER THAN ROOTBALL

INSECTICIDE NOTE:

Newly planted trees are susceptible to insects. Apply 'Coretect' Insecticide Tablets + Fert. (12-9-4) at time of planting. 3 tablets per caliper inch into top 1/3 of rootball. Then apply liquid insecticide soil drench in mid April for systemic control of most problem insects.

We recommend the following:

Landscape Professionals = 'SAFARI'

(Always following label directions & safety instruction)

Homeowners = 'BONIDE' 609 Tree/Shrub Drench

WATERING NOTES:

Too much water can be as detrimental to the livability of a tree as not applying enough. Monitor your watering practices to help ensure the success of your trees and your investment. Watering in the winter months is equally as critical as watering in the summer months as rootballs can dry out due to temps/wind.
